Introduction

One Size Doesn't Fit All:

The Vital Role of Personalized Medicine

Today's population is living longer than ever before. An aging population means more and more of us are likely to live with long-term health conditions that require medication at some point in our life. As a result, it is crucial that the medications we take are both safe and effective.

Unfortunately, many currently available medicines are adopting 'one size fits all' approach. Throughout history, individuals are given medication at a specific dose for a specific medical condition. However, due to genetic differences, the response to treatments can vary significantly between individuals, with some responding well and others experiencing little to no effect. Some may also experience unpleasant side effects from their prescription.

The failure of the traditional prescription approach does not only burden patients with additional physical discomfort and psychological stress, but also contributes to the rising cost of healthcare. To address these issues, personalized medicine has become increasingly important, with the goal of creating tailored treatments based on an individual's specific genetic makeup and medical history.

What is Pharmacogenomics?

Pharmacogenomics analyzes your unique genetic makeup to identify genetic variations that can affect your response to medication. By proactively testing your DNA, your response to a wide range of medications can be predicted, allowing healthcare providers to make more informed decisions about your treatment plan before you even start taking the medication.

Why Pharmacogenomics Test?

Our test covers predicted responses to an extensive list of medications and consists of:

- Report Overview
- Detailed Medication Report
- Scientific Evidence References
- Continuous Support

By sharing this pharmacogenomic report with your healthcare provider, you can avoid trial-and-error and get on the path to personalized medicine today.

Disclaimer

Recommendations given in this report are made using a lab-developed test which should not supersede clinical judgement or medical expertise.

The DNA test results are not intended to be used by you as a substitute for professional medical advice. You should always seek the advice of a healthcare provider or physician for any diagnostic purpose with any questions you may have regarding the diagnosis, cure, treatment, mitigation or prevention of any disease or other medical conditions or impairment or the status of your health.

The laboratory may not be able to process your sample or the laboratory process may result in errors. The laboratory may not be able to process your DNA sample if it does not contain a sufficient amount of DNA. Furthermore, if the DNA sample that you have provided is contaminated and/or corrupted, the accuracy of the DNA test result may be impacted. Even with stringent acceptance criteria for sample processing that meets our high standards, a small, unknown fraction of the data generated during the laboratory process may be un-interpretable or incorrect and may therefore not be able to generate a corresponding report.

The test detects four genes and twenty variants based on the recommendations of the various medical societies and regulatory bodies. The following genetic variants will be detected in the assay: CYP2D6 rs1065852, rs5030655, rs3892097, rs35742686, rs16947, rs28371725, rs1135840, rs769258, rs5030865, rs5030656, rs59421388, rs267608319, exon 9 conversion (*36), deletion (*5) and duplication; CYP2C9 rs1799853, rs1057910; CYP2C19 rs4244285, rs4986893, rs12248560 ; SLCO1B1 rs4149056.

The copy number assays in this test do not differentiate between partial and whole gene deletions and/or duplications. Copy number variants that are more than three cannot be detected with this test and may have to be detected with a different platform. Tandem-hybrid arrangements in CYP2D6 are not distinguished.

Any complex rearrangements or mosaicisms are also not detected in this test. A normal (wild-type) genotype signifies the absence of the targeted alleles and does not indicate the absence of other mutations not covered by the assay. The possibility cannot be ruled out that the indicated genotypes may be present and are below the limits of detection for this assay. The DNA test may not capture scientific findings which are not yet validated or not provided. Like all diagnostic tests, pharmacogenomic tests are one of multiple pieces of information that clinicians should consider when making therapeutic choice for each patient.

II. Legend

A. Summary of Follow Up Actions

Our knowledge base ranks and summarizes clinical recommendations published by expert consortia, regulatory bodies, and other trusted sources for drugs based on genetic information, along with clinical information of the patient. These symbols are a summary of the recommendation text next to it.

- | | |
|---|--|
| <p> Follow Standard Dosing
There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.</p> | <p> Increase Monitoring
Although patient has a varied genetic profile, the intended medication can still be prescribed as recommended, but with more frequent monitoring for quick action to be taken in the event of unwanted reactions.</p> |
| <p> Decrease Starting Dose
Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.</p> | <p> Increase Starting Dose
Patient has altered metabolism rate or reduced activation rate for drug indicated. Increased starting dose has shown to help patient into target therapeutic range faster and/or reduce the risk of drug clinical inefficacy.</p> |
| <p> Change Prescription
There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.</p> | |

B. Recommendation Caveats

These caveats are taken from pharmacogenomics guidelines, which will usually specify the required conditions and situations where the guideline is relevant. The various caveats are grouped below:

- | | |
|---|--|
| <p> Indication
This drug-gene interaction recommendation is based on a specific diagnosis ONLY. Exercise prudent clinical judgement when using the drug for other indications.</p> | <p> Initiation
This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.</p> |
| <p> Turnaround Time
The benefit of waiting for a genetic test result may be less than starting the medication without a genetic test result.</p> | <p> Predictive Value
Low positive predictive value. Testing positive for this phenotype does not mean that the patient will develop the adverse effect.</p> |

C. Level of Scientific Evidence

Our knowledge base ranks and summarizes the strength of clinical recommendations published by expert consortia, regulatory bodies, and other trusted sources for drugs based on DNA information, along with other clinical information of the patient. These texts are a summary of the level of scientific evidence available for the respective clinical recommendation as presented below.

STRONG RECOMMENDATION

You can follow the recommendation confidently because its effect has been categorized to improve clinical outcome by at least one of the following medical societies or regulatory bodies. Each guideline has different kinds of strength of evidence. We reclassified the following categories from each guideline into Strong Recommendation:

CPIC/CPNDS - Strong Recommendation OR DPWG - Level 3 or 4 level of evidence OR PRO - strong, essential or advisable test OR FDA/Other regulatory bodies - Testing required

MODERATE RECOMMENDATION

You can consider the recommendation as it has been categorized to have some potential clinical benefit by at least one of the following medical societies or regulatory bodies. We reclassified the following categories from each guideline into Moderate Recommendation:

CPIC/CPNDS - Moderate or optional recommendation OR DPWG - Level 2 level of evidence OR PRO - conditional or possibly helpful test OR FDA/Other regulatory bodies - Testing recommended or actionable PGx

INFORMATION AVAILABLE

The information provided serves as an additional point of consideration for the patient's therapy. The recommendation with insufficient data is also included as this category. We reclassified the following categories from each guideline into Information Available:

DPWG - Level 0 or 1 level of evidence OR FDA/Other regulatory bodies - Informative PGx

PGx Medical Societies

CPIC (Clinical Pharmacogenetics Implementation Consortium)

An international consortium of professionals interested in applying pharmacogenetics for patient care. Established in 2009, it consists of PGRN members, PharmGKB staff, and various experts. The guidelines are indexed in PubMed as clinical guidelines, endorsed by ASHP and ASCPT, and referenced in ClinGen and PharmGKB.

DPWG (Dutch Pharmacogenetics Working Group)

A multidisciplinary group of physicians, pharmacists, and other healthcare professionals. It was established in 2005 by the Royal Dutch Pharmacists Association (KNMP) with the objective of developing pharmacogenomic-based therapeutic (dose) recommendations. The guidelines are endorsed by the EACPT and the EAHP.

CPNDS (Canadian Pharmacogenomics Network for Drug Safety)

A pan-Canadian active surveillance network consisting of trained surveillance clinicians in 10 pediatric teaching hospitals across Canada, serving >75% of Canada's children. Established in 2005, the network's goal is to improve the safe use of medication by identifying genomic biomarkers of drug risk for serious ADRs.

PRO (Professional Societies)

A source that includes the French National Network of Pharmacogenetics (RNPgX), the Cystic Fibrosis Foundation and the American College of Rheumatology for appropriate drug presented.

Regulatory Bodies

FDA (Food and Drug Administration)

An agency within the US Department of Health and Human Services. It is responsible for protecting the public health by ensuring the safety, efficacy, and security of human and veterinary drugs, biological products, and medical devices.

EMA (European Medicines Agency)

A decentralised agency of the European Union (EU) responsible for the scientific evaluation, supervision and safety monitoring of medicines in the EU. EMA is a networking organisation whose activities involve thousands of experts from across Europe. These experts carry out the work of EMA's scientific committees.

PMDA (Pharmaceuticals and Medical Devices Agency)

A Japan agency that was established and came into service on April 1, 2004, under the Law for the Pharmaceuticals and Medical Devices Agency, as a part of the Japan Association for the Advancement of Medical Equipment (JAAME).

Swissmedic

The Swiss authority responsible for the authorisation and supervision of therapeutic products. The activities of Swissmedic are based on the Law on Therapeutic Products.

HCSC (Health Canada Santé Canada)

A federal department responsible for helping Canadians maintain and improve their health, while respecting individual choices and circumstances.

Each guideline and label annotation has its own strength of evidence for every drug-gene pair interaction.

D. Localization of Evidence

- The drugs presented in this report are all drugs that are available in your country.
- Our PGx recommendations are always supported by research findings from studies done in your ethnic population (e.g. if you are Chinese, we provide supporting scientific evidence from studies in the Chinese population).
- RxReady tests for genetic polymorphisms that are relevant in the Asian population.

III. Executive Report

PATIENT NAME	NATIONAL ID / PASSPORT NO.	ORDERING PROVIDER
tes UGM3	Not available	FAD Test Physician One
GENDER	DATE OF BIRTH	ORDER ID
Male	01 Jan 2000	8349-867687

A. Genomic Information

Gene	Genotype	Phenotype
CYP2C19	*17/*17	CYP2C19 Ultrarapid Metabolizer
CYP2C9	*1/*1	CYP2C9 Normal Metabolizer
CYP2D6	*4/*9	CYP2D6 Intermediate Metabolizer
SLCO1B1	Rs4149056(TT)	SLCO1B1 Normal Function

B. Current Medications

Information not available.

[Simvastatin 20 mg once daily at night](#)
[Atenolol 50 mg once daily at night](#)
[Propafenone 150 mg three times daily](#)
[Omeprazole 20 mg once daily before breakfast](#)
[Paroxetine 20 mg once daily at night](#)
[Phenytoin 100 mg three times daily](#)
[Sumatriptan 50 mg as needed for migraine \(max 200 mg/day\)](#)
[Amoxicillin/ Clavulanate 875 mg/125 mg twice daily for 7 days](#)

C. Pharmacogenomics Summary

1. Cardiovascular System

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Angiotensin II Receptor Blockers					Losartan CYP2C9
Antiangina					Ranolazine
Antiarrhythmics Class I	Propafenone		Flecainide		- Disopyramide - Quinidine
Antiarrhythmics Class I/III					Vernakalant
Antiarrhythmics Class III					- Amiodarone - Dronedarone CYP2D6
Anticoagulants					- Acenocoumarol CYP2C9 - Phenprocoumon CYP2C9 - Warfarin
Antihemorrhagics					Avatrombopag
Antiplatelets					- Aspirin CYP2C9 - Clopidogrel - Prasugrel CYP2C19 - Prasugrel CYP2C9 - Ticagrelor
Beta Blocking Agents					- Atenolol - Bisoprolol - Carvedilol - Metoprolol - Nebivolol - Propranolol - Sotalol - Timolol
Central Agonists					Clonidine

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Fibrates					Fenofibrate And Simvastatin
Nonselective NSAIDs					Aspirin CYP2C9
Statins					- Atorvastatin - Fluvastatin - Fluvastatin CYP2C9 - Fluvastatin SLCO1B1 - Lovastatin - Pitavastatin - Pravastatin - Rosuvastatin SLCO1B1 - Simvastatin

2. Dermatology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Others					- Abrocitinib CYP2C9 - Abrocitinib CYP2C19

3. Endocrinology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Blood Glucose Lowering Drugs					Nateglinide
Sulfonylureas					- Glibenclamide CYP2C9 - Gliclazide CYP2C9 - Glimepiride CYP2C9 - Tolbutamide CYP2C9

4. Family Medicine

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
1st Gen Antipsychotics			Zuclopenthixol		- Flupenthixol - Haloperidol - Perphenazine
2nd Gen Antipsychotics					- Aripiprazole - Aripiprazole Lauroxil - Brexpiprazole - Cariprazine - Clozapine CYP2D6 - Olanzapine CYP2D6 - Paliperidone - Quetiapine CYP2D6 - Risperidone
Alpha Blockers					Tamsulosin
Analgesics					Rimegepant
Angiotensin II Receptor Blockers					Losartan CYP2C9
Antiangina					Ranolazine
Antiarrhythmics Class I	Propafenone		Flecainide		
Antiarrhythmics Class III					- Amiodarone - Dronedarone CYP2D6
Anticholinergics					- Tiotropium - Umeclidinium
Anticoagulants					Warfarin
Antiemetics And Antinauseants					- Ondansetron - Palonosetron
Antiepileptics					- Clobazam - Diazepam
Antifungals	Voriconazole CYP2C19				- Terbinafine - Voriconazole CYP2C9

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antimetabolites					Methotrexate
Antimuscarinics					Tolterodine
Antiplatelets					- Aspirin CYP2C9 - Clopidogrel - Prasugrel CYP2C19 - Prasugrel CYP2C9 - Ticagrelor
Anxiolytics					Diazepam
Atypical Antidepressants					- Mirtazapine CYP2C19 - Mirtazapine CYP2D6
Beta Blocking Agents					- Atenolol - Bisoprolol - Carvedilol - Metoprolol - Nebivolol - Propranolol - Sotalol - Timolol
COX-2 Selective NSAIDs					Celecoxib
Cough Suppressants					Dextromethorphan
Fibrates					Fenofibrate And Simvastatin
Long-Acting Beta Agonists					- Formoterol CYP2C19 - Formoterol CYP2D6
Monoamine Oxidase A Inhibitors					Moclobemide

Name : tes UGM3
Date of Birth : 01 Jan 2000

Order ID : #8349-867687
Report Date : 21 Jan 2025

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Nonselective NSAIDs					• Aceclofenac • Aspirin CYP2C9 • Diclofenac CYP2C9 • Flurbiprofen • Ibuprofen • Indomethacin • Meloxicam • Naproxen • Piroxicam
Opioid Cough Suppressants					• Codeine
Opioids					• Oxycodone • Tramadol CYP2D6
Other Antidepressants					• Vortioxetine
Others					• Abrocitinib CYP2C9 • Drospirenone And Ethinylestradiol • Eletriptan • Abrocitinib CYP2C19
Propulsives					• Metoclopramide CYP2D6
Proton Pump Inhibitors		• Dexlansoprazole • Lansoprazole • Omeprazole • Pantoprazole			• Esomeprazole • Rabeprazole
Psychostimulants					• Atomoxetine

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Selective Serotonin Reuptake Inhibitors	- Citalopram CYP2C19 - Escitalopram CYP2C19		Paroxetine		- Citalopram CYP2D6 - Escitalopram CYP2D6 - Fluoxetine - Fluvoxamine CYP2C19 - Fluvoxamine CYP2D6 - Sertraline CYP2C19 - Sertraline CYP2D6
Selective Serotonin And Norepinephrine Reuptake Inhibitors					Venlafaxine
Serotonin/Norepinephrine Reuptake Inhibitors					- Desvenlafaxine - Duloxetine
Statins					- Atorvastatin - Fluvastatin - Fluvastatin CYP2C9 - Fluvastatin SLCO1B1 - Lovastatin - Pitavastatin - Pravastatin - Rosuvastatin SLCO1B1

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Sulfonylureas					- Glibenclamide CYP2C9 - Gliclazide CYP2C9 - Glimepiride CYP2C9 - Tolbutamide CYP2C9
Tricyclic Antidepressants	- Amitriptyline - Amitriptyline CYP2C19 - Clomipramine - Clomipramine CYP2C19 - Imipramine - Imipramine CYP2C19		- Amitriptyline CYP2D6 - Clomipramine CYP2D6 - Imipramine CYP2D6 - Nortriptyline		

5. Gastrointestinal System

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antiemetics And Antinauseants					- Dronabinol - Ondansetron - Palonosetron - Tropisetron
Others					Eliglustat
Propulsives					Metoclopramide CYP2D6
Proton Pump Inhibitors		- Dexlansoprazole - Lansoprazole - Omeprazole - Pantoprazole			- Esomeprazole - Rabeprazole

6. Gynecology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Alpha Blockers					Tamsulosin
Antimuscarinics					- Darifenacin - Fesoterodine - Tolterodine
Beta Agonist					Mirabegron
Hypothalamic Hormones					Elagolix
Others					- Drospirenone And Ethinylestradiol - Flibanserin CYP2C19 - Flibanserin CYP2C9 - Flibanserin CYP2D6
Selective Estrogen Receptor Modulators					Ospemifene CYP2C9

8. Infectious Disease

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antifungals	Voriconazole CYP2C19				- Terbinafine - Voriconazole CYP2C9
Antimalarials					Quinine CYP2D6
Antiretrovirals					- Atazanavir - Nelfinavir - Ritonavir
Antivirals					Letermovir

9. Musculoskeletal System

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antigouts					Lesinurad
Muscle Relaxants					Tolperisone

10. Neurology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antidementia Drugs					- Donepezil - Galantamine
Antiepileptics					- Brivaracetam CYP2C19 - Brivaracetam CYP2C9 - Clobazam - Diazepam - Fosphenytoin - Lacosamide - Phenytoin CYP2C19 - Phenytoin CYP2C9
Anxiolytics					Diazepam
Others				Tetrabenazine	- Cevimeline - Deutetrabenazine - Eletriptan - Valbenazine

11. Oncology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Antimetabolites					Methotrexate
Estrogen Receptor Antagonists	Tamoxifen				
Immunosuppressants					Upadacitinib
Other Antineoplastic Agents					Rucaparib
Protein Kinase Inhibitors					- Axitinib - Erdafitinib - Gefitinib - Ibrutinib

12. Ophthalmology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Beta Blocking Agents					Timolol

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

Report Date : 21 Jan 2025

13. Pain Management

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Analgesics					- Paracetamol, Caffeine, And Dihydrocodeine - Paracetamol, Combinations Excl. Psycholeptics - Rimegepant
Antiplatelets					Aspirin CYP2C9
COX-2 Selective NSAIDs					- Celecoxib - Lumiracoxib
Muscle Relaxants					Carisoprodol
Nonselective NSAIDs					- Aceclofenac - Aspirin CYP2C9 - Diclofenac CYP2C9 - Dipyrene - Flurbiprofen - Ibuprofen - Indomethacin - Lornoxicam - Meloxicam - Nabumetone - Naproxen - Piroxicam - Tenoxicam
Opioids					- Oliceridine - Oxycodone - Tramadol CYP2D6

14. Psychiatry

Drug Class	Change Prescription	Increase Starting Dose	Decrease Starting Dose	Monitor	Follow Standard Dosing
1st Gen Antipsychotics			- Pimozide - Zuclopenthixol		- Flupenthixol - Haloperidol - Perphenazine - Thioridazine
2nd Gen Antipsychotics					- Aripiprazole - Aripiprazole Lauroxil - Brexipiprazole - Cariprazine - Clozapine CYP2D6 - Iloperidone - Olanzapine CYP2D6 - Paliperidone - Quetiapine CYP2D6 - Risperidone - Sertindole
Antiepileptics					Diazepam
Anxiolytics					Diazepam
Atypical Antidepressants				Bupropion	- Mirtazapine CYP2C19 - Mirtazapine CYP2D6
Drugs Used In Addictive Disorders					Lofexidine
Drugs Used In Opioid Dependence					Methadone CYP2D6
Monoamine Oxidase A Inhibitors					Moclobemide
Other Antidepressants					Vortioxetine

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Psychostimulants					- Amfetamine - Atomoxetine - Methylphenidate - Modafinil - Pitolisant
Selective Serotonin Reuptake Inhibitors	- Citalopram CYP2C19 - Escitalopram CYP2C19		Paroxetine		- Citalopram CYP2D6 - Escitalopram CYP2D6 - Fluoxetine - Fluvoxamine CYP2C19 - Fluvoxamine CYP2D6 - Sertraline CYP2C19 - Sertraline CYP2D6
Selective Serotonin And Norepinephrine Reuptake Inhibitors					Venlafaxine
Serotonin Reuptake Inhibitors					Nefazodone
Serotonin/Norepinephrine Reuptake Inhibitors					- Desvenlafaxine - Duloxetine

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Tricyclic Antidepressants	- Amitriptyline - Amitriptyline CYP2C19 - Clomipramine - Clomipramine CYP2C19 - Doxepin - Doxepin CYP2C19 - Imipramine - Imipramine CYP2C19 - Trimipramine - Trimipramine CYP2C19		- Amitriptyline CYP2D6 - Clomipramine CYP2D6 - Desipramine - Doxepin CYP2D6 - Imipramine CYP2D6 - Nortriptyline - Trimipramine CYP2D6		- Amoxapine - Protriptyline

15. Respiratory System

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Anticholinergics					- Tiotropium - Umeclidinium
Antihistamines				Meclizine	
Cough Suppressants					- Dextromethorphan - Dextromethorphan And Quinidine
Long-Acting Beta Agonists					- Arformoterol - Formoterol CYP2C19 - Formoterol CYP2D6
Opioid Cough Suppressants					- Codeine - Hydrocodone

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

16. Urology

Drug Class	 Change Prescription	 Increase Starting Dose	 Decrease Starting Dose	 Monitor	 Follow Standard Dosing
Alpha Blockers					Tamsulosin
Antimuscarinics					- Darifenacin - Fesoterodine - Tolterodine
Beta Agonist					Mirabegron
Selective Serotonin Reuptake Inhibitors					Dapoxetine

INFORMATION
AVAILABLE

GENE
CYP2C9

GENOTYPE
*1/*1

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

> No actionable recommendation available for this drug-gene pair.

The pharmacokinetics of this drug is not significantly impacted by CYP2C9 genetic variants in vivo and/or there is insufficient evidence to provide a recommendation to guide clinical practice at this time.

Recommendations based on specific guidelines

> CPIC No actionable recommendation available for this drug-gene pair.

Caveat

Rare CYP2C9 variants may not be detected in genotype tests, classifying patients with these variants as having a normal metabolizer (NM) phenotype based on CYP2C9*1/1 results. The CYP2C9*1 allele may harbor reduced or non-functional variants, so reports should specify the variants or SNPs analyzed. CYP2C9 genotype is one of many factors to consider when prescribing NSAIDs. Age, sex, ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI risk. Use with caution in elderly patients, as they have reduced CYP2C9 metabolism and increased renal/GI risks. Combining NSAIDs with antiplatelets or anticoagulants raises bleeding risk or can interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✓ Follow Standard Dosing

There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

GENOTYPE

*17/*17
*4/*9

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider alternative drug not metabolized by CYP2C19.

CYP2D6 IM: Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds. Higher plasma concentrations of active drug may increase probability of side effects. CYP2C19 UM: Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

- > **CPIC** Consider alternative drug not metabolized by CYP2C19. If amitriptyline is warranted, utilize therapeutic drug monitoring to guide dose adjustment.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✗ Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

CYP2C19 Ultrarapid Metabolizer

Recommendation

> Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19.

Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

> CPIC **Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19. Tricyclic antidepressants (TCAs) without major CYP2C19 metabolism include the secondary amines nortriptyline and desipramine. If a tertiary amine is warranted, utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.**

DPWG No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider 25% reduction of recommended starting dose.

Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds when compared to normal metabolizers. Higher plasma concentrations of active drug will increase the probability of side effects.

Recommendations based on specific guidelines

> CPIC	Consider 25% reduction of recommended starting dose. Patients may receive an initial low dose of a tricyclic, which is then increased over several days to the recommended steady-state dose. Utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Use 75% of the standard dose and monitor the efficacy and side effects or the plasma concentrations.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↓ Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

Atomoxetine

Atomoxetine, Strattera

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer
(non-*10)

Recommendation

- **Initiate with 40 mg/day and increase to 80 mg/day after 3 days.**
Possibly higher atomoxetine concentrations but questionable clinical significance.

Recommendations based on specific guidelines

➤ CPIC	Initiate with 40 mg/day and increase to 80 mg/day after 3 days. If no clinical response and in the absence of adverse events after 2 weeks, consider increasing to 100 mg/day. If no clinical response observed after 2 weeks, consider obtaining a peak plasma concentration 1 to 2 hours after dose administered. If <200 ng/mL, consider a proportional increase to approach 400 ng/mL. Therapeutic range of 200 to 1000 ng/mL has been proposed. Modest improvement in response (reduction in ADHD-RS) is observed at peak concentrations >400 ng/mL. Dosages >100 mg/day may be needed to achieve target concentrations.
DPWG	Occurrence of side effects and/or a response later than 9 weeks: reduce dose. Check whether the effect is conserved. Plasma concentration is 2-3 times higher for IM than for EM at the same dose.

Caveat

Available exposure-response data from clinical trials are derived from concentrations drawn 60–90 minutes after dosing; although this measure may not be the best predictor of response, the relationship between other exposure measures, such as trough concentration at steady state, steady-state AUC, unbound atomoxetine concentrations, or total active compounds (unbound atomoxetine + unbound 4-OH aglycone), has not been evaluated.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

- ✓ **Follow Standard Dosing**
There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

PHENOTYPE
SLCO1B1 Normal Function

Recommendation

- > Prescribe desired starting dose and adjust doses based on disease-specific guidelines.
Typical myopathy risk and statin exposure.

Recommendations based on specific guidelines

- > CPIC Prescribe desired starting dose and adjust doses based on disease-specific guidelines.

Caveat

Genetic variation is just one factor when prescribing statins. Rare variants may not be included in the genotype test. Patients with rare variants that reduce SLCO1B1 function may be incorrectly assigned a normal phenotype. Many patients' statin therapy is never restarted after Statin-related musculoskeletal symptoms. As a result, LDL cholesterol values are higher as is their risk for cardiovascular disease. The evidenced-based recommendations for genotype-guided statin therapy are focused on reducing the risk of SAMS.

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **It may be necessary to decrease the dose of CYP2D6 substrates when used concomitantly with bupropion.**
Co-administration of bupropion with drugs that are metabolized by CYP2D6 can increase the exposures of drugs that are substrates of CYP2D6.

Recommendations based on specific guidelines

- **FDA** It may be necessary to decrease the dose of CYP2D6 substrates when used concomitantly with bupropion. Particularly for drugs with a narrow therapeutic index. Patients treated concomitantly with bupropion and drugs that require metabolic activation by CYP2D6 to be effective may require increased doses of the drug.

Source

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

- > Initiate therapy with recommended starting dose.**
Normal metabolism.

Recommendations based on specific guidelines

- > CPIC** **Initiate therapy with recommended starting dose. In accordance with the prescribing information, use the lowest effective dosage for shortest duration consistent with individual patient treatment goals.**

Caveat

Age, sex, race and ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors (genetic and environmental) influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI adverse events. Usage in elderly patients must be with caution, as they have reduced CYP2C9 metabolism and increased renal risk and GI adverse events. Use extreme caution when combining NSAIDs with antiplatelets or anticoagulants as it can raise bleeding risk or interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Citalopram || CYP2C19

Citalopram

GENE	GENOTYPE	PHENOTYPE
CYP2C19	*17/*17	CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Consider a clinically appropriate alternative antidepressant not predominantly metabolized by CYP2C19.**
Increased metabolism of citalopram and escitalopram to less active compounds when compared to CYP2C19 rapid and normal metabolizers. Lower plasma concentrations decrease the probability of clinical benefit.

Recommendations based on specific guidelines

➤ CPIC	Consider a clinically appropriate alternative antidepressant not predominantly metabolized by CYP2C19. If citalopram or escitalopram are clinically appropriate, and adequate efficacy is not achieved at standard maintenance dosing, consider titrating to a higher maintenance dose. Drug-drug interactions and other patient characteristics (e.g., age, renal function, liver function) should be considered when adjusting dose or selecting an alternative therapy.
DPWG	No actionable recommendation available for this drug-gene pair.

Caveat
Patients on a stable and effective dose of an SSRI most likely will not benefit from additional dose modifications based on CYP2D6 or CYP2C19 genotype results. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source
Publications related to local relevance for this drug-gene pair have not been published yet.

✖ Change Prescription There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.	START Initiation This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

GENE

CYP2C19
CYP2D6

GENOTYPE

*17/*17
*4/*9

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider alternative drug not metabolized by CYP2C19.

CYP2D6 IM: Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds. Higher plasma concentrations of active drug may increase probability of side effects. CYP2C19 UM: Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

- > **CPIC** Consider alternative drug not metabolized by CYP2C19. If tricyclic antidepressants (TCAs) is warranted, utilize therapeutic drug monitoring to guide dose adjustment.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✖ Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

Clomipramine || CYP2C19

Anafranil, Apo-Clomipramine, Clomipramine, Depranil

**MODERATE
RECOMMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

➤ Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19.

Increased metabolism of tertiary amines compared to normal metabolizers. Greater conversion of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

➤ CPIC	Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19. Tricyclic antidepressants (TCAs) without major CYP2C19 metabolism include the secondary amines nortriptyline and desipramine. If a tertiary amine is warranted, utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Indication OBSESSIVE COMPULSIVE DISORDER or ANXIETY DISORDERS: avoid clomipramine. Indication DEPRESSION: no action required. If clomipramine is warranted, monitor the effect and side effects or the plasma concentrations.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✖ Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

Clomipramine || CYP2D6

Anafranil, Apo-Clomipramine, Clomipramine, Depranil

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider 25% reduction of recommended starting dose.

Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds when compared to normal metabolizers. Higher plasma concentrations of active drug will increase the probability of side effects.

Recommendations based on specific guidelines

> CPIC	Consider 25% reduction of recommended starting dose. Patients may receive an initial low dose of a tricyclic, which is then increase over several days to the recommended steady-state dose. Utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Use 70% of the standard dose. Monitor the effect and side effects of the plasma concentrations of clomipramine and desmethylclomipramine.
FDA	Monitor TCA plasma levels when co-administering Clomipramine with a P450 2D6 inhibitor.

More information about this drug-phenotype can also be found at **SWISSMEDIC**.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↓ Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

START Initiation

**STRONG
RECOMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **If considering clopidogrel, use at standard dose (75 mg/day).**
Increased clopidogrel active metabolite formation; lower on-treatment platelet reactivity; no association with higher bleeding risk.

Recommendations based on specific guidelines

➤	CPIC	If considering clopidogrel, use at standard dose (75 mg/day).
	DPWG	No actionable recommendation available for this drug-gene pair.
	PRO	There is no guideline concerning the appropriate dosage to prescribe for a patient with the *17 allele.
	EMA	No actionable recommendation available for this drug-gene pair.

Caveat

An assigned CYP2C19*1 allele could potentially harbor an undetected genetic variant. Most clinical laboratories do not currently test for CYP2C19 deletions or structural variants. Therefore, clinical providers should understand which CYP2C19 variant alleles were genotyped when interpreting results. CYP2C19 genotype is just one factor that clinicians should consider when prescribing clopidogrel.

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **Use codeine label recommended age- or weight-specific dosing.**
Reduced morphine formation.

Recommendations based on specific guidelines

➤ CPIC	Use codeine label recommended age- or weight-specific dosing. If no response and opioid use is warranted, consider a non-tramadol opioid.
DPWG	For COUGH: No action required. For PAIN: Be alert to a reduced effectiveness. In the case of inadequate effectiveness: try a dose increase, if this does not work: choose an alternative. Do not select tramadol, as this is also metabolized by CYP2D6. Morphine is not metabolized by CYP2D6. Oxycodone is metabolized by CYP2D6 to a limited extent, but this does not result in differences in analgesia in patients. If no alternative is selected: advise the patient to report inadequate analgesia. It is not possible to offer adequately substantiated advice for dose adjustment based on the limited available literature for this phenotype.

More information about this drug-phenotype can also be found at **CPNDS**.

Caveat

Like all diagnostic tests, CYP2D6 genotype is one of multiple pieces of information that clinicians should consider in guiding their therapeutic choice for each patient. Furthermore, there are several other factors that cause potential uncertainty in the genotyping results and phenotype predictions.

INFORMATION
AVAILABLE

GENE
CYP2C9

GENOTYPE
*1/*1

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

> No actionable recommendation available for this drug-gene pair.

The pharmacokinetics of this drug is not significantly impacted by CYP2C9 genetic variants in vivo and/or there is insufficient evidence to provide a recommendation to guide clinical practice at this time.

Recommendations based on specific guidelines

> CPIC No actionable recommendation available for this drug-gene pair.

Caveat

Rare CYP2C9 variants may not be detected in genotype tests, classifying patients with these variants as having a normal metabolizer (NM) phenotype based on CYP2C9*1/1 results. The CYP2C9*1 allele may harbor reduced or non-functional variants, so reports should specify the variants or SNPs analyzed. CYP2C9 genotype is one of many factors to consider when prescribing NSAIDs. Age, sex, ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI risk. Use with caution in elderly patients, as they have reduced CYP2C9 metabolism and increased renal/GI risks. Combining NSAIDs with antiplatelets or anticoagulants raises bleeding risk or can interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

CYP2D6

GENOTYPE

*17/*17
*4/*9

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider alternative drug not metabolized by CYP2C19.

CYP2D6 IM: Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds. Higher plasma concentrations of active drug may increase probability of side effects. CYP2C19 UM: Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

- > **CPIC** Consider alternative drug not metabolized by CYP2C19. If tricyclic antidepressants (TCAs) is warranted, utilize therapeutic drug monitoring to guide dose adjustment.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✖ Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

**MODERATE
RECOMMENDATION**

GENE

CYP2C19

GENOTYPE

*17/*17

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer

Recommendation

➤ Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19.

Increased metabolism of tertiary amines compared to normal metabolizers. Greater conversion of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

CPIC

Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19. Tricyclic antidepressants (TCAs) without major CYP2C19 metabolism include the secondary amines nortriptyline and desipramine. If a tertiary amine is warranted, utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.

DPWG

No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Doxepin || CYP2D6

Apo-Doxepin, Doxepin, Sagalon

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider 25% reduction of recommended starting dose.

Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds when compared to normal metabolizers. Higher plasma concentrations of active drug will increase the probability of side effects.

Recommendations based on specific guidelines

> CPIC	Consider 25% reduction of recommended starting dose. Patients may receive an initial low dose of a tricyclic, which is then increase over several days to the recommended steady-state dose. Utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Use 80% of the standard dose and monitor the effect and side effects or the plasma concentrations of doxepin and nordoxepin in order to set the maintenance dose. The therapeutic range is 100-250 ng/mL for the sum of doxepin and nordoxepin plasma concentrations. Values higher than 400 ng/mL are considered toxic.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↓ Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

🩺 Indication

This drug-gene interaction recommendation is based on a specific diagnosis ONLY. Exercise prudent clinical judgement when using the drug for other indications.

Eliglustat

Eliglustat

INFORMATION
AVAILABLE

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **Use the standard dose If NO co-medication with a moderate or strong CYP2D6 or CYP3A inhibitor or strong CYP3A inducer.**
This gene variation reduces the conversion of eliglustat to inactive metabolites. However, in the absence of CYP2D6 and CYP3A inhibitors, this does not result in a clinically significant increase risk of side effects.

Recommendations based on specific guidelines

➤ DPWG	Use the standard dose If NO co-medication with a moderate or strong CYP2D6 or CYP3A inhibitor or strong CYP3A inducer. Co-medication with BOTH a MODERATE to STRONG CYP2D6 INHIBITOR AND a MODERATE to STRONG CYP3A INHIBITOR: Eliglustat is contra-indicated. 1. Choose an alternative if possible. Co-medication with a STRONG CYP2D6 INHIBITOR: 1. Use a dose of 84mg eliglustat 1x daily. Co-medication with a MODERATE CYP2D6 INHIBITOR: 1. Consider a dose of 84mg eliglustat 1x daily. 2. Be alert to side effects. Co-medication with a STRONG CYP3A INHIBITOR: 1. Choose an alternative if possible. 2. If an alternative is not an option: consider a dose of 84 mg eliglustat 1x daily and be alert to side effects. Co-medication with a MODERATE CYP3A INHIBITOR: 1. Choose an alternative. 2. If an alternative is not an option: consider a dose of 84mg eliglustat 1x daily and be alert to side effects. Co-medication with a STRONG CYP3A INDUCER: Eliglustat is not recommended. The plasma concentration may decrease so sharply that a therapeutic effect cannot be achieved. 1. Choose an alternative if possible.
FDA	CYP2D6 IMs: 84 mg orally 2x daily. Co-administration with strong CYP3A inhibitors is contraindicated in intermediate and poor CYP2D6 metabolizers.

More information about this drug-phenotype can also be found at [EMA](#).

Escitalopram || CYP2C19

Ciprallex, Depram, Elxion, Escipra, Escitalopram, Escitalopram Oxalate, Lepax, Lexapro

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Consider a clinically appropriate alternative antidepressant not predominantly metabolized by CYP2C19.**
Increased metabolism of citalopram and escitalopram to less active compounds when compared to CYP2C19 rapid and normal metabolizers. Lower plasma concentrations decrease the probability of clinical benefit.

Recommendations based on specific guidelines

➤ CPIC	Consider a clinically appropriate alternative antidepressant not predominantly metabolized by CYP2C19. If citalopram or escitalopram are clinically appropriate, and adequate efficacy is not achieved at standard maintenance dosing, consider titrating to a higher maintenance dose. Drug-drug interactions and other patient characteristics (e.g., age, renal function, liver function) should be considered when adjusting dose or selecting an alternative therapy.
DPWG	Avoid escitalopram. Choose drugs that are not metabolized or that are metabolized to a lesser extent by CYP2C19.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

Patients on a stable and effective dose of an SSRI most likely will not benefit from additional dose modifications based on CYP2D6 or CYP2C19 genotype results. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Flecainide

Flecainide, Tambocor

**STRONG
RECOMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **Indications other than diagnosis of Brugada syndrome: reduce the dose to 75% of the standard dose and record an ECG and monitor the plasma concentration.**
The genetic variation reduces conversion of flecainide to inactive metabolites. This may increase the risk of side effects.

Recommendations based on specific guidelines

- **DPWG** **Indications other than diagnosis of Brugada syndrome: reduce the dose to 75% of the standard dose and record an ECG and monitor the plasma concentration. Provocation test for diagnosis of Brugada syndrome: No action required. At a dose of 2.0 mg/kg body weight to a maximum of 150 mg, the response is better for patients with alleles that result in reduced activity. All 5 patients with these alleles and 20% of the patients with two fully active alleles exhibited a response within 30 minutes.**

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

- ⬇ **Decrease Starting Dose**
Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

Flurbiprofen

Flurbiprofen, Froben, Strepfen

**STRONG
RECOMENDATION**

GENE
CYP2C9

GENOTYPE
*1/*1

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

- > Initiate therapy with recommended starting dose.**
Normal metabolism.

Recommendations based on specific guidelines

- > CPIC** **Initiate therapy with recommended starting dose. In accordance with the prescribing information, use the lowest effective dosage for shortest duration consistent with individual patient treatment goals.**

Caveat
Age, sex, race and ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors (genetic and environmental) influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI adverse events. Usage in elderly patients must be with caution, as they have reduced CYP2C9 metabolism and increased renal risk and GI adverse events. Use extreme caution when combining NSAIDs with antiplatelets or anticoagulants as it can raise bleeding risk or interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Source
Publications related to local relevance for this drug-gene pair have not been published yet.

- ✓ Follow Standard Dosing**
There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

- ⚠ Indication**
This drug-gene interaction recommendation is based on a specific diagnosis ONLY. Exercise prudent clinical judgement when using the drug for other indications.

Fluvastatin

Fluvastatin, Lescol

**STRONG
RECOMENDATION**

GENE

SLCO1B1
CYP2C9

GENOTYPE

rs4149056(TT)
*1/*1

PHENOTYPE

SLCO1B1 Normal Function
CYP2C9 Normal Metabolizer

Recommendation

- **Prescribe desired starting dose and adjust doses of fluvastatin based on disease-specific guidelines.**
CYP2C9 Normal function: Normal exposure. SLCO1B1 Normal metabolizer: Typical myopathy risk and statin exposure.

Recommendations based on specific guidelines

- **CPIC** **Prescribe desired starting dose and adjust doses of fluvastatin based on disease-specific guidelines.**

Caveat

Genetic variation is just one factor when prescribing statins. Rare variants may not be included in the genotype test. Patients with rare variants that reduce SLCO1B1 function may be incorrectly assigned a normal phenotype. Many patients' statin therapy is never restarted after Statin-related musculoskeletal symptoms. As a result, LDL cholesterol values are higher as is their risk for cardiovascular disease. The evidenced-based recommendations for genotype-guided statin therapy are focused on reducing the risk of SAMS.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

Follow Standard Dosing

There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

- > **CPIC** **Initiate therapy with recommended starting dose. In accordance with the prescribing information, use the lowest effective dosage for shortest duration consistent with individual patient treatment goals.**

Caveat

Age, sex, race and ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors (genetic and environmental) influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI adverse events. Usage in elderly patients must be with caution, as they have reduced CYP2C9 metabolism and increased renal risk and GI adverse events. Use extreme caution when combining NSAIDs with antiplatelets or anticoagulants as it can raise bleeding risk or interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

- ✓ **Follow Standard Dosing**
There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

RECOMMENDATION**

GENE

CYP2C19
CYP2D6

GENOTYPE

*17/*17
*4/*9

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider alternative drug not metabolized by CYP2C19.

CYP2D6 IM: Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds. Higher plasma concentrations of active drug may increase probability of side effects. CYP2C19 UM: Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

- > **CPIC** Consider alternative drug not metabolized by CYP2C19. If tricyclic antidepressants (TCAs) is warranted, utilize therapeutic drug monitoring to guide dose adjustment.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✖ Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

Apo-Imipramine, Imipramine

**MODERATE
RECOMMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

➤ Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19.

Increased metabolism of tertiary amines compared to normal metabolizers. Greater conversion of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

➤ CPIC Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19. Tricyclic antidepressants (TCAs) without major CYP2C19 metabolism include the secondary amines nortriptyline and desipramine. If a tertiary amine is warranted, utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.

DPWG No action is required for this gene-drug interaction.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Apo-Imipramine, Imipramine

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider 25% reduction of recommended starting dose.

Reduced metabolism of tricyclic antidepressants (TCAs) to less active compounds when compared to normal metabolizers. Higher plasma concentrations of active drug will increase the probability of side effects.

Recommendations based on specific guidelines

> CPIC	Consider 25% reduction of recommended starting dose. Patients may receive an initial low dose of a tricyclic, which is then increase over several days to the recommended steady-state dose. Utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Use 70% of the standard dose and monitor the side effect or the plasma concentrations of imipramine and desipramine. Monitoring is done in order to set the maintenance dose. The therapeutic range is 150-300 ng/mL for the sum of the imipramine and desipramine plasma concentrations. Values exceeding 500 ng/mL are considered toxic.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↓ Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.**
Decreased plasma concentrations of PPIs compared with CYP2C19 NMs; increase risk of therapeutic failure.

Recommendations based on specific guidelines

➤ CPIC	Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.
DPWG	For <i>Helicobacter pylori</i> ERADICATION THERAPY: 1. Use a 4-fold higher dose. 2. Advise the patient to contact their doctor if symptoms of dyspepsia persist. OTHER INDICATIONS: 1. Be alert to reduced effectiveness. 2. If necessary, use a 4-fold higher dose. 3. Advise the patient to report persisting symptoms of dyspepsia.

Caveat

There are important limitations to CYP2C19 genetic tests. Targeted genotyping tests focus on known star (*) alleles and are not designed to detect novel variants. Rare allelic CYP2C19 variants may not be included in the genotype test, and patients with these variants may be assigned an NM phenotype (CYP2C19*1/*1) by default. An assigned *1 allele could harbor an undetected CYP2C19 variant that alters metabolism and drug exposure. Rare alleles with gene deletions at the CYP2C19 locus (*36 and *37) have been reported; however, most clinical laboratories do not test for CYP2C19 copy number variants or deletions. Clinical providers must understand the limitations of targeted genotyping and which CYP2C19 variant alleles were tested when interpreting results. CYP2C19 genotype is just one factor clinicians should consider when prescribing PPIs.

GENOTYPE
rs4149056(TT)

PHENOTYPE
SLCO1B1 Normal Function

Recommendation

- **Prescribe desired starting dose and adjust doses based on disease-specific guidelines.**
Typical myopathy risk and statin exposure.

Recommendations based on specific guidelines

- **CPIC** Prescribe desired starting dose and adjust doses based on disease-specific guidelines.

Caveat

Genetic variation is just one factor when prescribing statins. Rare variants may not be included in the genotype test. Patients with rare variants that reduce SLCO1B1 function may be incorrectly assigned a normal phenotype. Many patients' statin therapy is never restarted after Statin-related musculoskeletal symptoms. As a result, LDL cholesterol values are higher as is their risk for cardiovascular disease. The evidenced-based recommendations for genotype-guided statin therapy are focused on reducing the risk of SAMS.

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Initiate standard dosing.

Decreased metabolism of metoprolol leading to increased drug concentrations; however, this does not have any clinically significant changes in heart rate, blood pressure, or clinical outcomes.

Recommendations based on specific guidelines

CPIC

Initiate standard dosing.

DPWG

GRADUAL REDUCTION in HEART RATE or SYMPTOMATIC BRADYCARDIA: prescribe no more than 50% of the standard dose. The use of smaller steps in dose titration can also be done together or as another option. For OTHER CASES: no action required.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

Follow Standard Dosing

There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

GENE
CYP2C9

GENOTYPE
*1/*1

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

> No recommendation is available for this drug-gene pair.

The pharmacokinetics of this drug is not significantly impacted by CYP2C9 genetic variants in vivo and/or there is insufficient evidence to provide a recommendation to guide clinical practice at this time.

Recommendations based on specific guidelines

> CPIC No recommendation is available for this drug-gene pair.

Caveat

Rare CYP2C9 variants may not be detected in genotype tests, classifying patients with these variants as having a normal metabolizer (NM) phenotype based on CYP2C9*1/1 results. The CYP2C9*1 allele may harbor reduced or non-functional variants, so reports should specify the variants or SNPs analyzed. CYP2C9 genotype is one of many factors to consider when prescribing NSAIDs. Age, sex, ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI risk. Use with caution in elderly patients, as they have reduced CYP2C9 metabolism and increased renal/GI risks. Combining NSAIDs with antiplatelets or anticoagulants raises bleeding risk or can interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

✓ Follow Standard Dosing

There is a low chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism, no change is necessary.

Nortriptyline

Apo-Nortriptyline, Nortriptyline

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider 25% reduction of recommended starting dose.

Reduced metabolism of TCAs to less active compounds when compared to normal metabolizers. Higher plasma concentrations of active drug will increase the probability of side effects.

Recommendations based on specific guidelines

> CPIC	Consider 25% reduction of recommended starting dose. Patients may receive an initial low dose of a tricyclic, which is then increase over several days to the recommended steady-state dose. The starting dose in this guideline refers to the recommended steady-state dose. Utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.
DPWG	Use 60% of the standard dose. Monitor effect and side effects or plasma concentration to set maintenance dose. The therapeutic range of nortriptyline is 50-150 ng/mL. Values exceeding 250 ng/mL are considered toxic.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↓ Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

START Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.**
Decreased plasma concentrations of PPIs compared with CYP2C19 NMs; increase risk of therapeutic failure.

Recommendations based on specific guidelines

➤ CPIC	Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.
DPWG	For Helicobacter pylori ERADICATION THERAPY: 1. use a 3-fold higher dose. 2. advise the patient to contact their doctor if symptoms of dyspepsia persist. OTHER INDICATIONS: 1. be alert to reduced effectiveness. 2. if necessary, use a 3-fold higher dose. 3. advise the patient to report persisting symptoms of dyspepsia.

Caveat

There are important limitations to CYP2C19 genetic tests. Targeted genotyping tests focus on known star (*) alleles and are not designed to detect novel variants. Rare allelic CYP2C19 variants may not be included in the genotype test, and patients with these variants may be assigned an NM phenotype (CYP2C19*1/*1) by default. An assigned *1 allele could harbor an undetected CYP2C19 variant that alters metabolism and drug exposure. Rare alleles with gene deletions at the CYP2C19 locus (*36 and *37) have been reported; however, most clinical laboratories do not test for CYP2C19 copy number variants or deletions. Clinical providers must understand the limitations of targeted genotyping and which CYP2C19 variant alleles were tested when interpreting results. CYP2C19 genotype is just one factor clinicians should consider when prescribing PPIs.

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **Initiate therapy with recommended starting dose. Insufficient evidence showing clinical impact based on CYP2D6 genotype.**

Very limited data available for CYP2D6 intermediate metabolizers.

Recommendations based on specific guidelines

- **CPIC** **Initiate therapy with recommended starting dose. Insufficient evidence showing clinical impact based on CYP2D6 genotype.**

FDA No actionable recommendation available for this drug-gene pair.

More information about this drug-phenotype can also be found at **SWISSMEDIC**.

Caveat

Rare CYP2D6 variants may not be included in the genotype test used and patients with rare variants may be assigned a “wildtype” (CYP2D6*1) genotype by default. Thus, an assigned “wildtype” allele could potentially harbor a no or decreased function variant. Furthermore, it is important that the genetic testing platform include testing for gene copy number to identify CYP2D6 UMs. Caution should be used regarding molecular diagnostics of CYP2D6 gene copy-number variation because commercially available genotyping results may differ between diagnostic laboratories depending on assay design. Like all diagnostic tests, CYP2D6 genotype is one of multiple pieces of information that clinicians should consider when making their therapeutic choice.

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.**
Decreased plasma concentrations of PPIs compared with CYP2C19 NMs; increase risk of therapeutic failure.

Recommendations based on specific guidelines

➤	CPIC	Increase starting daily dose by 100%. Daily dose may be given in divided doses. Monitor for efficacy.
	DPWG	For Helicobacter pylori ERADICATION THERAPY: 1. Use a 5-fold higher dose. 2. Advise the patient to contact their doctor if symptoms of dyspepsia persist. OTHER INDICATIONS: 1. Be alert to reduced effectiveness. 2. If necessary, use a 5-fold higher dose. 3. advise the patient to report persisting symptoms of dyspepsia.

Caveat

There are important limitations to CYP2C19 genetic tests. Targeted genotyping tests focus on known star (*) alleles and are not designed to detect novel variants. Rare allelic CYP2C19 variants may not be included in the genotype test, and patients with these variants may be assigned an NM phenotype (CYP2C19*1/*1) by default. An assigned *1 allele could harbor an undetected CYP2C19 variant that alters metabolism and drug exposure. Rare alleles with gene deletions at the CYP2C19 locus (*36 and *37) have been reported; however, most clinical laboratories do not test for CYP2C19 copy number variants or deletions. Clinical providers must understand the limitations of targeted genotyping and which CYP2C19 variant alleles were tested when interpreting results. CYP2C19 genotype is just one factor clinicians should consider when prescribing PPIs.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

↑ Increase Starting Dose

Patient has altered metabolism rate or reduced activation rate for drug indicated. Increased starting dose has shown to help patient into target therapeutic range faster and/or reduce the risk of drug clinical inefficacy.

👤 Indication

This drug-gene interaction recommendation is based on a specific diagnosis ONLY. Exercise prudent clinical judgement when using the drug for other indications.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

Paroxetine

Apo-Paroxetine, Paroxetine, Seroxat

**MODERATE
RECOMMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- **Consider a lower starting dose and slower titration schedule as compared to normal metabolizers.**
Reduced metabolism of paroxetine to less active compounds when compared to CYP2D6 normal metabolizers when starting treatment or at lower doses.

Recommendations based on specific guidelines

➤ CPIC	Consider a lower starting dose and slower titration schedule as compared to normal metabolizers. Drug-drug interactions and other patient characteristics (e.g., age, renal function, liver function) should be considered when adjusting dose or selecting an alternative therapy.
DPWG	No action is needed for this gene-drug interaction.
FDA	No actionable recommendation available for this drug-gene pair.

Caveat

Patients on a stable and effective dose of an SSRI most likely will not benefit from additional dose modifications based on CYP2D6 or CYP2C19 genotype results. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

The curated publications relevant to the drug-gene pair and reported ethnicity are listed below:

24868171

Decrease Starting Dose

Patient has altered metabolism rate or enhanced activation rate for drug indicated. Decreasing starting dose has shown to help prevent patient from experiencing adverse drug reaction.

Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

Pimozide

Pimozide

**STRONG
RECOMENDATION**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Use no more than 80% of the standard maximum dose: 16 mg/day (12 years and older).

The risk of QT-prolongation – and thereby also the risk of torsade de points – is theoretically increase, because the genetic variation results in an increase in the plasma concentration of pimozide. The risk of an excessively high plasma concentration can be negated by following the dose recommendations provided.

Recommendations based on specific guidelines

DPWG

Use no more than 80% of the standard maximum dose: 16 mg/day (12 years and older).

Source

PHENOTYPE
CYP2C9 Normal Metabolizer

Recommendation

- **Initiate therapy with recommended starting dose.**
Normal metabolism.

Recommendations based on specific guidelines

- **CPIC** **Initiate therapy with recommended starting dose. In accordance with the prescribing information, use the lowest effective dosage for shortest duration consistent with individual patient treatment goals.**

Caveat

Age, sex, race and ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors (genetic and environmental) influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI adverse events. Usage in elderly patients must be with caution, as they have reduced CYP2C9 metabolism and increased renal risk and GI adverse events. Use extreme caution when combining NSAIDs with antiplatelets or anticoagulants as it can raise bleeding risk or interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Recommendation

- **Prescribe desired starting dose and adjust doses based on disease-specific guidelines.**
Typical myopathy risk and statin exposure.

Recommendations based on specific guidelines

- **CPIC** Prescribe desired starting dose and adjust doses based on disease-specific guidelines.

Caveat

Genetic variation is just one factor when prescribing statins. Rare variants may not be included in the genotype test. Patients with rare variants that reduce SLCO1B1 function may be incorrectly assigned a normal phenotype. Many patients' statin therapy is never restarted after Statin-related musculoskeletal symptoms. As a result, LDL cholesterol values are higher as is their risk for cardiovascular disease. The evidenced-based recommendations for genotype-guided statin therapy are focused on reducing the risk of SAMS.

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> No actionable recommendation available for this drug-gene pair.

There is little evidence to support an increase in side effects caused by the genetic variation. The genetic variation may lead to a decrease in the required maintenance dose. However, as the effect on the dose is smaller than that of the normal biological variation, action is not useful.

Recommendations based on specific guidelines

> DPWG No actionable recommendation available for this drug-gene pair.

**STRONG
RECOMENDATION**

GENE
SLCO1B1

GENOTYPE
rs4149056(TT)

PHENOTYPE
SLCO1B1 Normal Function

Recommendation

- **Prescribe desired starting dose and adjust doses based on disease-specific guidelines.**
Typical myopathy risk and statin exposure.

Recommendations based on specific guidelines

- **CPIC** Prescribe desired starting dose and adjust doses based on disease-specific guidelines.

Caveat

Genetic variation is just one factor when prescribing statins. Rare variants may not be included in the genotype test. Patients with rare variants that reduce SLCO1B1 function may be incorrectly assigned a normal phenotype. Many patients' statin therapy is never restarted after Statin-related musculoskeletal symptoms. As a result, LDL cholesterol values are higher as is their risk for cardiovascular disease. The evidenced-based recommendations for genotype-guided statin therapy are focused on reducing the risk of SAMS.

**STRONG
RECOMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- > Initiate therapy with recommended starting dose.**
Small increase in metabolism of sertraline to less active compounds when compared to CYP2C19 normal metabolizers.

Recommendations based on specific guidelines

> CPIC	Initiate therapy with recommended starting dose. CYP2B6 metabolizer status, drug-drug interactions, and other patient characteristics (e.g., age, renal function, liver function) should also be considered.
DPWG	No actionable recommendation available for this drug-gene pair.

Caveat

Patients on a stable and effective dose of an SSRI most likely will not benefit from additional dose modifications based on CYP2D6 or CYP2C19 genotype results. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

PHENOTYPE
CYP2D6 Intermediate Metabolizer
(non-*10)

Recommendation

➤ **Consider aromatase inhibitor (AI) for postmenopausal or AI with ovarian function suppression for premenopausal women.**

Lower endoxifen concentrations; higher risk of breast cancer recurrence, event-free, and recurrence-free survival.

Recommendations based on specific guidelines

➤ CPIC	Consider aromatase inhibitor (AI) for postmenopausal or AI with ovarian function suppression for premenopausal women. If AI use is contraindicated, consideration should be given to use a higher but FDA approved tamoxifen dose (40 mg/day). Avoid CYP2D6 strong to weak inhibitors.
DPWG	Select an alternative or measure the endoxifen concentration and increase the dose if necessary by a factor of 1.5-2. Aromatase inhibitors are a possible alternative for post-menopausal women. If TAMOXIFEN is selected: avoid co-medication with CYP2D6 inhibitors such as paroxetine and fluoxetine.
PRO	No actionable recommendation available for this drug-gene pair.
FDA	The impact of CYP2D6 intermediate or poor metabolism on efficacy is not well established.

More information about this drug-phenotype can also be found at **CPNDS** and **HCSC**.

Caveat

For the treatment of ER1 breast cancer, there are well-accepted tumor somatic factors that drive endocrine response, including the tumor expression of ER, PR, and HER2 expression, and other multigene assays that are associated with endocrine sensitivity. Although there are very few data, the implication of reduced CYP2D6 metabolism in patients with low-risk breast cancer (e.g., early-stage breast cancer where the risk of distant recurrence is low) may be substantially different than in patients with later stage disease with a much higher risk of distant recurrence.

Recommendation

- > Initiate therapy with recommended starting dose.**
Normal metabolism.

Recommendations based on specific guidelines

- > CPIC** **Initiate therapy with recommended starting dose. In accordance with the prescribing information, use the lowest effective dosage for shortest duration consistent with individual patient treatment goals.**

Caveat
Age, sex, race and ethnicity, liver dysfunction, comorbidities, concomitant medications, genetic linkage with CYP2C8, and other factors (genetic and environmental) influence adverse event risk. NSAIDs should be avoided in patients with renal dysfunction, heart failure, or high cardiovascular or GI adverse events. Usage in elderly patients must be with caution, as they have reduced CYP2C9 metabolism and increased renal risk and GI adverse events. Use extreme caution when combining NSAIDs with antiplatelets or anticoagulants as it can raise bleeding risk or interfere with platelet inhibition in the case of aspirin. NSAIDs also reduce antihypertensive efficacy, necessitating cautious use in hypertensive patients.

Recommendation

- **Use tramadol label recommended age- or weight-specific dosing.**
Reduced O-desmethyltramadol (active metabolite) formation.

Recommendations based on specific guidelines

➤ CPIC	Use tramadol label recommended age- or weight-specific dosing. If no response and opioid use is warranted, consider a non-codeine opioid.
DPWG	1. Be alert to a reduced effectiveness. 2. In the case of inadequate effectiveness: try a dose increase. If this does not work: choose an alternative. Do not select codeine, as this is also metabolized by CYP2D6. Morphine is not metabolized by CYP2D6. Oxycodone is metabolized by CYP2D6 to a limited extent, but this does not result in differences in analgesia in patients. 3. If no alternative is selected: advise the patient to report inadequate analgesia. It is not possible to provide a recommendation for dose adjustment, because the total analgesic effect changes when the ratio between the mother compound and the active metabolite changes.

Caveat

Like all diagnostic tests, CYP2D6 genotype is one of multiple pieces of information that clinicians should consider in guiding their therapeutic choice for each patient. Furthermore, there are several other factors that cause potential uncertainty in the genotyping results and phenotype predictions.

GENE

CYP2C19
CYP2D6

GENOTYPE

*17/*17
*4/*9

PHENOTYPE

CYP2C19 Ultrarapid Metabolizer
CYP2D6 Intermediate Metabolizer

Recommendation

> Consider alternative drug not metabolized by CYP2C19.

CYP2D6 IM: Reduced metabolism of TCAs to less active compounds. Higher plasma concentrations of active drug may increase probability of side effects. CYP2C19 UM: Increased metabolism of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

CPIC

Consider alternative drug not metabolized by CYP2C19. If tricyclic antidepressants (TCAs) is warranted, utilize therapeutic drug monitoring to guide dose adjustment.

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

Source

Publications related to local relevance for this drug-gene pair have not been published yet.

Change Prescription

There is a high chance of sub-optimal response or adverse reaction due to patient's genetic polymorphism.

Initiation

This drug-gene interaction recommendation is useful for initiation of this drug in naive patients. For patients who are already on stable dose or have used this drug before, effective drug monitoring and clinical judgement is more important.

This report was validated and generated automatically. No signature is required. Recommendations given in this report are made using a lab developed test which should not supersede clinical judgement or medical expertise.

RECOMMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

> Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19.

Increased metabolism of tertiary amines compared to normal metabolizers. Greater conversion of tertiary amines to secondary amines may affect response or side effects.

Recommendations based on specific guidelines

> CPIC **Avoid tertiary amine use due to potential for sub-optimal response. Consider alternative drug not metabolized by CYP2C19. Tricyclic antidepressants (TCAs) without major CYP2C19 metabolism include the secondary amines nortriptyline and desipramine. If a tertiary amine is warranted, utilize therapeutic drug monitoring to guide dose adjustments. Titrate dose to observed clinical response with symptom improvement and minimal (if any) side effects.**

Caveat

The application of genotype-based dosing is most appropriate when initiating therapy with a tricyclic. Obtaining a pharmacogenetic test after months of drug therapy may be less helpful in some instances, as the drug dose may have already been adjusted based on plasma concentrations, response, or side effects. Similar to all diagnostic tests, genetic tests are one of several pieces of clinical information that should be considered before initiating drug therapy.

**INFORMATION
AVAILABLE**

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

> Insufficient evidence showing clinical impact based on CYP2D6 genotype. Initiate therapy with recommended starting dose.

Very limited data available for CYP2D6 intermediate metabolizers.

Recommendations based on specific guidelines

> CPIC **Insufficient evidence showing clinical impact based on CYP2D6 genotype. Initiate therapy with recommended starting dose.**

Caveat

Rare CYP2D6 variants may not be included in the genotype test used and patients with rare variants may be assigned a "wildtype" (CYP2D6*1) genotype by default. Thus, an assigned "wildtype" allele could potentially harbor a no or decreased function variant. Furthermore, it is important that the genetic testing platform include testing for gene copy number to identify CYP2D6 UMs. Caution should be used regarding molecular diagnostics of CYP2D6 gene copy-number variation because commercially available genotyping results may differ between diagnostic laboratories depending on assay design. Like all diagnostic tests, CYP2D6 genotype is one of multiple pieces of information that clinicians should consider when making their therapeutic choice.

Venlafaxine

Avenfax, Deprevix, Efexor, Venladex Xr, Venlafaxine, Venlex Xr, Viepax

INFORMATION
AVAILABLE

GENE
CYP2D6

GENOTYPE
*4/*9

PHENOTYPE
CYP2D6 Intermediate Metabolizer

Recommendation

- No action recommended based on genotype because of minimal evidence regarding the impact on efficacy or side effects.**
Decreased metabolism of venlafaxine to active metabolite O-desmethylvenlafaxine (desvenlafaxine) and decreased O-desmethylvenlafaxine : venlafaxine ratio as compared to CYP2D6 normal metabolizers.

Recommendations based on specific guidelines

CPIC	No action recommended based on genotype because of minimal evidence regarding the impact on efficacy or side effects.
DPWG	Avoid venlafaxine. Antidepressants that are not metabolized by CYP2D6 - or to a lesser extent - include, for example, duloxetine, mirtazapine, citalopram and sertraline. If it is not possible to avoid venlafaxine and side effects occur: reduce the dose, monitor the effect and side effects or check the plasma concentrations of venlafaxine and O-desmethylvenlafaxine. It is not known whether it is possible to reduce the dose to such an extent that the side effects disappear, while the effectiveness is maintained. In general, it is assumed that the effectiveness is determined by the sum of the plasma concentrations of venlafaxine and O-desmethylvenlafaxine. However, the side effects do not appear to be related to this sum. It is not possible to offer adequately substantiated advice for dose reduction based on the literature.

Caveat

Patients on stable and effective antidepressant medication doses without significant tolerability concerns may not benefit from dose modifications based on CYP2D6, CYP2C19, and/or CYP2B6 genotype results. Pharmacogenetic test results are one of many pieces of clinical information to be considered when optimizing antidepressant drug therapy.

Voriconazole || CYP2C19

Vfend, Vorica, Voriconazole, Voriconazole Sandoz, Vorigen, Voritrop

**MODERATE
RECOMMENDATION**

GENE
CYP2C19

GENOTYPE
*17/*17

PHENOTYPE
CYP2C19 Ultrarapid Metabolizer

Recommendation

- **Choose an alternative agent that is not dependent on CYP2C19 metabolism as primary therapy in lieu of voriconazole.**

In patients for whom an ultrarapid metabolizer genotype is identified, the probability of attainment of therapeutic voriconazole concentrations is small with standard dosing.

Recommendations based on specific guidelines

➤ CPIC	Choose an alternative agent that is not dependent on CYP2C19 metabolism as primary therapy in lieu of voriconazole. Such agents include isavuconazole, liposomal amphotericin B, and posaconazole. Further dose adjustments or selection of alternative therapy may be necessary due to other clinical factors, such as drug interactions, hepatic function, renal function, species, site of infection, TDM, and comorbidities. Recommendations based upon data extrapolated from patients with CYP2C19*1/*17 genotype
DPWG	Use an initial dose that is 1.5x higher and monitor the plasma concentration.
PRO	Consider antifungal agents other than voriconazole if patient is a known CYP2C19 ultrarapid metabolizer.
EMA	No actionable recommendation available for this drug-gene pair.

More information about this drug-phenotype can also be found at **PMDA**.

Caveat

CYP2C19 genotyping cannot replace TDM, as other factors (i.e., drug interactions, hepatic function, renal function, species, site of infection, and comorbidities) also influence the use of voriconazole. Rare CYP2C19 variants are typically not included in common genotyping tests and patients are therefore assigned the "wild-type" (CYP2C19*1) allele by default. Thus, in rare cases, an assigned "wild-type" allele may harbor a no, decreased, or increase function variant. An individual's predicted CYP2C19 metabolizer status may also depend on other factors, including epigenetic phenomena, diet, comorbidities, or comedications.
